

László Hortobágyi (Hortator) :
Terranomia (Anaplasia musicarcinoma diagnosis) 2011
CD-liner Text

'*Terranomia*' is a circumscribed superterrestrial proliferation of human tissue resulting from the progressive, irreversible proliferation of altered (*anomic*) cells of terrestrial existence, whose growth continues after the removal of the triggering factors, and is completely independent of the organism's social consciousness as a regulatory mechanism.

Continental tumours of human mould may have a *malignant* (or *malignus*) or, hardly ever, a *benign* (or *benignus*) nature.

The term '*Terranomia*' means literally '*anomy on the surface of Earth*', and from time to time, it is used in this very meaning as well; so, it is one of the five classical symptoms of *Gaia*-inflammation (*gaia-inflammo*), but since it is a reactive mass, its development can't be stopped, not even by eliminating the reasons.

The topographic *malignant* tumours with an earth-epithelium origin (*malignoma*) are collectively known as *carcinoma*, but that is also frequently (and improperly) used by lay language and science to designate each and every *malignant* mass.

General characteristic feature of *malignant* human-biomass-tumours with a false consciousness and hemispheric saturation is to be able to infiltrate into and damage the surrounding tissues (spreading in the environment, its technical term is '*locoregional invasion*', and besides they can create distant metastases (*metastasis*) as well.

In case of *benign* social tumours (*mēmcomplex*) and historic ages, neither invasiveness nor formation of metastases is symptomatic, however, they are able to realize very significant growth, though in a longer period than the *malignant* ones, but as to the symptomatologic effects, they imply the same deleterious consequences on some favoured points of the World, as a *malignant* human-mass of earth-epithelium.

For example, the tumour of *amygdala*, originating from the original evolutionary programming of *hypophysis*, the *mēmetic* projection of which on its local environment has an effect of annihilation.

In the course of full military and parliamentary free-market cauterizing, the chance of recurrence of *benign* conscious-tumours (*mēmanomia*) is far smaller than in case of *malignant* deformations.

The first sign of invasiveness of a local tumour with an earth-epithelium origin is

when during the local spreading it gets beyond the basic membrane of the epidermic tissue (*basalis lamina*). Then, the human-mass, not being able to break through the *basalis lamina*, still showing some *malignant* cellular deformations, is called *in situ carcinoma*.

In course of earthlife, the *DNA* of social consciousness will accumulate more and more hereditary mutation in the genetic material of human mould, primarily during the first steps constituting the integral part of *mēmetic cytokinezis*, exactly because of the '*copying imperfections*' taking place during the duplication (*replication*) of the genetic material, and for the reason of malfunctions of human-ecological consciousness improving mechanisms working on the correction of the abovementioned phenomena. To some extent, this might explain why the occurrence of some kind of '*terrnomia*'-s, first of all the *malignant* humanoid histological types, is growing together with the geohistorical age (*prevalence*).

It is also important to mention, that *anaplasia* is in connection with the social-histological classification of the prevailing hemispheric newborn human-tumour generation. Consequently, *anaplastic* tumours are so called low level differentiated deformations, that means a cell level differentiation (*taigetos syndrome*), being controlled by the predestination (*karma*) factor, namely the being borne into a *predestinativ* caste, the *social mēmcomplex strata*, and it would regrettably mean, that neoplasms of *socium* are going to germinate even in their early stage of maturation, and thus they may not show anomic formal and functional characteristics of a fully developed human epidermic tissue. So, the *anaplastic* deformations are usually *malignus*, but a *malignus* deformation is not always *anaplastic*, and that provides a possibility for the genetic material of earthly '*consciousness-carrier*' to be preserved for a possible future rebirth.

We can declare that the repeated terrestrial reappearance of '*divine terrnomia*' - as socio-evolutionary feedback - is a way of dealing with the surplus of people pushed to the periphery in the mythopoetic '*Kondratyev*' cycles of capitalism, like *desomorphine* (i.e. *crocodile*), sex and cable *TV* or *acid-rock-trance* music, or everyday *Virtual Reality*, community *Medea*-s, *COVID* and the *Big Data* in private hands.

But I consider them very obsolete today, because they are less efficient than cheaply and ecologically incinerating the sociological surplus extracted from social homeostasis in Icelandic volcanic craters with a helicopter (e.g. *Chinook Ch-47* type) loading *paternoster* input system (cf. *Pater Noster* prayer), uploading in *kanban-lego* mode.

(In *Europe*, the most common are *Eyjafjallajökull*, *Bárðarbunga* in *Iceland*, or *Mount Etna* in *Sicily*.)

The probability of avoiding a new reincarnation of innate terranomic conscious-programming of the human genome, created by the *God* to his similarity, may only be comparable to the probability of accidental appearance of the planetary bioplasm on a molecular level.
